Adjustable bronze side-pads on extensions

Despite the high precision design of an EFFER crane that is achieved by laser cutting, robot welding and the exceptional gauge precision of the SSAB steels, the tolerations occurring at the assembly stage may produce some side play between each boom extension.

This play, particularly on very long booms, may create a lack of precision in the manoeuvres which is unacceptable on an EFFER crane.

The solution developed by EFFER features a series of side-pads, made with a special bronze and fully adjustable, that keep the side-play down to a minimum.
